**Type:** p = permanent, r = reproducing, c = concentration, w = wintering (for plant and non-migratory species use permanent)

**Unit:** i = individuals, p = pairs or other units according to the Standard list of population units and codes in accordance with Article 12 and 17 reporting (see [reference portal](#))

**Abundance categories (Cat.):** C = common, R = rare, V = very rare, P = present - to fill if data are deficient (DD) or in addition to population size information

**Data quality:** G = 'Good' (e.g. based on surveys); M = 'Moderate' (e.g. based on partial data with some extrapolation); P = 'Poor' (e.g. rough estimation); VP = 'Very poor' (use this category only, if not even a rough estimation of the population size can be made, in this case the fields for population size can remain empty, but the field "Abundance categories" has to be filled in)

#### Other Site Characteristics

This site comprises the extreme inner part of Donegal Bay. Several large rivers, notably the River Eske, enter the site. It is typically estuarine in character, with large expanses of intertidal sand and mud flats, channels, saltmarsh, sand dunes and sandy and shingle beaches. Several grassy islands occur in the site. The site provides habitat for a diversity of estuarine bird species, and the islands are used by *Anser albifrons flavirostris*. The area is underlain by limestone and shale bedrock from the carboniferous era.

#### 4.2 Quality and importance

The site is a good example of a sheltered estuarine system, with extensive intertidal sand and mud flats mostly of good quality. The Murvagh peninsula still has some areas of fixed dunes and humid dune slacks, though these dune habitats are only of moderate quality. The population of *Phoca vitulina* is one of the largest in the country. The site is of some importance for estuarine birds and is visited by *Anser albifrons flavirostris*. *Pyrola rotundifolia*, a Red Data Book species, is found on the site.
